Key Features

- Industry standard footprint
  47.8 x 28.1 x max height 8.0 mm (1.88 x 1.11 x max height 0.32 in.)
- High efficiency, typ. 83 % at 5.0 Vout full load
- 1500 Vdc input to output isolation
- Meets isolation requirements equivalent to basic insulation according to IEC/EN/UL 60950
- More than 7.2 million hours predicted MTBF at 40°C ambient temperature

General Characteristics

- Over current protection
- Soft start
- Remote control
- Output voltage adjust function
- Input voltage adjust function
- Highly automated manufacturing to ensure highest quality
- ISO 9001/14001 certified supplier

Reliability
The Mean Time Between Failure (MTBF) is calculated at full output power and an operating ambient temperature (T_A) of +40°C, which is a typical condition in Information and Communication Technology (ICT) equipment. Different methods could be used to calculate the predicted MTBF and failure rate which may give different results. Ericsson Power Modules currently uses one method, Telcordia SR332.

Predicted MTBF for the series is:
- 7.2 million hours according to Telcordia SR332, issue 1, Black box technique.

Telcordia SR332 is a commonly used standard method intended for reliability calculations in ICT equipment. The part count procedure used in this method was originally modelled on the methods from MIL-HDBK-217F, Reliability Predictions of Electronic Equipment. It assumes that no reliability data is available on the actual units and devices for which the predictions are to be made, i.e. all predictions are based on generic reliability parameters.

Compatibility with RoHS requirements
The products are compatible with the relevant clauses and requirements of the RoHS directive 2011/65/EU and have a maximum concentration value of 0.1% by weight in homogeneous materials for lead, mercury, hexavalent chromium, PBB and PBDE and of 0.01% by weight in homogeneous materials for cadmium.

Exemptions in the RoHS directive utilized in Flex products are found in the Statement of Compliance document.

Flex fulfills and will continuously fulfill all its obligations under regulation (EC) No 1907/2006 concerning the registration, evaluation, authorization and restriction of chemicals (REACH) as they enter into force and is through product materials declarations preparing for the obligations to communicate information on substances in the products.

Quality Statement
The products are designed and manufactured in an industrial environment where quality systems and methods like ISO 9000, Six Sigma, and SPC are intensively in use to boost the continuous improvements strategy. Infant mortality or early failures in the products are screened out and they are subjected to an ATE-based final test. Conservative design rules, design reviews and product qualifications, plus the high competence of an engaged work force, contribute to the high quality of the products.

Warranty
Warranty period and conditions are defined in Flex General Terms and Conditions of Sale.

Limitation of Liability
Flex does not make any other warranties, expressed or implied including any warranty of merchantability or fitness for a particular purpose (including, but not limited to, use in life support applications, where malfunctions of product can cause injury to a person’s health or life).

© Flex 2017
The information and specifications in this technical specification is believed to be correct at the time of publication. However, no liability is accepted for inaccuracies, printing errors or for any consequences thereof. Flex reserves the right to change the contents of this technical specification at any time without prior notice.

Safety Specification

General Information
Flex DC/DC converters and DC/DC regulators are designed in accordance with the safety standards IEC 60950-1, EN 60950-1 and UL 60950-1 Safety of Information Technology Equipment.

IEC/EN/UL 60950-1 contains requirements to prevent injury or damage due to the following hazards:
- Electrical shock
- Energy hazards
- Fire
- Mechanical and heat hazards
- Radiation hazards
- Chemical hazards

On-board DC/DC converters and DC/DC regulators are defined as component power supplies. As components they cannot fully comply with the provisions of any safety requirements without “conditions of acceptability”. Clearance between conductors and between conductive parts of the component power supply and conductors on the board in the final product must meet the applicable safety requirements. Certain conditions of acceptability apply for component power supplies with limited stand-off (see Mechanical Information and Safety Certificate for further information). It is the responsibility of the installer to ensure that the final product
housing these components complies with the requirements of all applicable safety standards and regulations for the final product.

Component power supplies for general use should comply with the requirements in IEC/EN/UL 60950-1 *Safety of Information Technology Equipment*. Product related standards, e.g. IEEE 802.3af *Power over Ethernet*, and ETS-300132-2 *Power interface at the input to telecom equipment, operated by direct current (dc)* are based on IEC/EN/UL 60950-1 with regards to safety.

Flex DC/DC converters, Power interface modules and DC/DC regulators are UL 60950-1 recognized and certified in accordance with EN 60950-1. The flammability rating for all construction parts of the products meet requirements for V-0 class material according to IEC 60695-11-10, *Fire hazard testing, test flames – 50 W horizontal and vertical flame test methods.*

**Isolated DC/DC converters & Power interface modules**

The product may provide basic or functional insulation between input and output according to IEC/EN/UL 60950-1 (see Safety Certificate), different conditions shall be met if the output of a basic or a functional insulated product shall be considered as safety extra low voltage (SELV).

For basic insulated products (see Safety Certificate) the output is considered as safety extra low voltage (SELV) if one of the following conditions is met:

- The input source provides supplementary or double or reinforced insulation from the AC mains according to IEC/EN/UL 60950-1.
- The input source provides functional or basic insulation from the AC mains and the product’s output is reliably connected to protective earth according to IEC/EN/UL 60950-1.

For functional insulated products (see Safety Certificate) the output is considered as safety extra low voltage (SELV) if one of the following conditions is met:

- The input source provides double or reinforced insulation from the AC mains according to IEC/EN/UL 60950-1.
- The input source provides basic or supplementary insulation from the AC mains and the product’s output is reliably connected to protective earth according to IEC/EN/UL 60950-1.
- The input source is reliably connected to protective earth and provides basic or supplementary insulation according to IEC/EN/UL 60950-1 and the maximum input source voltage is 60 Vdc.

Galvanic isolation between input and output is verified in an electric strength test and the isolation voltage ($V_{\text{iso}}$) meets the voltage strength requirement for basic insulation according to IEC/EN/UL 60950-1.

It is recommended to use a slow blow fuse at the input of each DC/DC converter. If an input filter is used in the circuit the fuse should be placed in front of the input filter. In the rare event of a component problem that imposes a short circuit on the input source, this fuse will provide the following functions:

- Isolate the fault from the input power source so as not to affect the operation of other parts of the system
- Protect the distribution wiring from excessive current and power loss thus preventing hazardous overheating
Absolute Maximum Ratings

Stress in excess of Absolute Maximum Ratings may cause permanent damage. Absolute Maximum Ratings, sometimes referred to as no destruction limits, are normally tested with one parameter at a time exceeding the limits of Output data or Electrical Characteristics. If exposed to stress above these limits, function and performance may degrade in an unspecified manner.

**Start-up**

Start-up enabled by connecting V_i at:

\[ T_	ext{ref} = +25\,^\circ\text{C}, I_O = 1.2 \, \text{A resistive load}, \text{resistive load}. \]

Top trace: output voltage (2.0 V/div.), Bottom trace: input voltage (50 V/div.), Time scale: (2 ms/div.).

**Shut-down**

Shut-down enabled by disconnecting V_i at:

\[ T_	ext{ref} = +25\,^\circ\text{C}, I_O = 1.2 \, \text{A resistive load}. \]

Top trace: output voltage (2.0 V/div.), Bottom trace: input voltage (50 V/div.), Time scale: (2 ms/div.).

**Output Ripple & Noise**

Output voltage ripple at:

\[ T_	ext{ref} = +25\,^\circ\text{C}, I_O = 1.2 \, \text{A resistive load}. \]

Trace: output voltage (20 mV/div.), Time scale: (2 µs/div.).

**Output Load Transient Response**

Output voltage response to load current step-change (0.3-0.9-0.3 A) at:

\[ T_	ext{ref} = +25\,^\circ\text{C}, V_i = 53 \, \text{V}. \]

Top trace: output voltage (200 mV/div.), Bottom trace: load current (0.5 A/div.), Time scale: (0.2 ms/div.).

**Output Voltage Adjust (see operating information)**

**Passive adjust**
The resistor value for increasing output voltage is got by using the below table:

<table>

**EMC Specification**

Conducted EMI measured according to EN55022, CISPR 22 and FCC part 15J (see test set-up). See Design Note 009 for further information. The fundamental switching frequency is 450 kHz for PKR 4910A SI @ \( V_i = 53 \) V, max \( I_o \).

**Conducted EMI Input terminal value (typ)**

**External filter (class B)**

Required external input filter in order to meet class B in EN 55022, CISPR 22 and FCC part 15J.

**Filter components:**
- \( C1 = 1\mu F \) 100V
- \( C2 = 10\mu F \) 100V
- \( C3,C4 = 2.2nF \)
  - 1500Vdc
- \( L1 = \text{Pulse PO354} \)
  - 1.17mH

**Test set-up**

**Layout recommendation**

The radiated EMI performance of the DC/DC converter will depend on the PCB layout and ground layer design. It is also important to consider the stand-off of the DC/DC converter.

A ground layer will increase the stray capacitance in the PCB and improve the high frequency EMC performance.

**Output ripple and noise**

Output ripple and noise measured according to figure below.

```

```

**Output ripple and noise test setup**

```
Output ripple and noise test setup
```
PKR 4000 series Direct Converters
Input 36-75 V, Output up to 1.2 A / 6 W

Operating information

Input Voltage
The input voltage range 38...72 Vdc meets the requirements of the European Telecom Standard ETS 300 132-2 for normal input voltage range in -48 and -60 Vdc systems, -40.5...-57.0 V and -50.0...-72 V respectively.

At input voltages exceeding 72 V, the power loss will be higher than at normal input voltage and Tref must be limited to absolute max +85°C. The absolute maximum continuous input voltage is 75 Vdc.

Turn-off Input Voltage
The converters monitor the input voltage and will turn on and turn off at predetermined levels. The minimum hysteresis between turn on and turn off input voltage is 1 V.

To increase \( V_{\text{on}} \) a resistor should be connected between pin 11 and 17. The resistance is given by the following equation:

\[
R_{\text{set(up)}} = \frac{X \cdot V_{\text{on}}}{V_{\text{on}} - V_{\text{ion}}} \text{k}\Omega
\]

To decrease \( V_{\text{on}} \) a resistor should be connected between pin 10 and 11. The resistance is given by the following equation:

\[
R_{\text{set(down)}} = \frac{51(V_{\text{on}} - Y)(V_{\text{ion}} - V_{\text{on}})}{Y} \text{k}\Omega
\]

<table>
<thead>
<tr>
<th>Variants/Parameters</th>

</tr>
</thead>
<tbody>
<tr>
<td>ROA 128 5246/2</td>
<td>34.5</td>
<td>2549</td>
<td>30.1</td>
</tr>
</tbody>
</table>

\( V_{\text{off}} \) is the adjusted turn-off input voltage and is determined by \( V_{\text{ion}} - V_{\text{off}} = 1.2 \text{V} \) (Typical value).

Remote Control (RC)
The products are fitted with a remote control function referenced to the primary negative input connection (- In), and have positive logic. The RC function allows the converter to be turned on/off by an external device like a semiconductor or mechanical switch.

The maximum required sink current is 1 mA. When the RC pin is left open, the voltage generated on the RC pin is <16 V. To ensure that the converter stays off the voltage must be below 1.0 V.

Input and Output Impedance
The impedance of both the input source and the load will interact with the impedance of the DC/DC converter. It is important that the input source has low characteristic impedance. The converters are designed for stable operation without external capacitors connected to the input or output.

The performance in some applications can be enhanced by addition of external capacitance as described under External Decoupling Capacitors. If the input voltage source contains significant inductance, the addition of a 10 \( \mu \text{F} \) capacitor across the input of the converter will ensure stable operation.

The capacitor is not required when powering the DC/DC converter from an input source with an inductance below 10 \( \mu \text{H} \).

External Decoupling Capacitors
When powering loads with significant dynamic current requirements, the voltage regulation at the point of load can be improved by addition of decoupling capacitors at the load. The most effective technique is to locate low ESR ceramic and electrolytic capacitors as close to the load as possible by using several parallel capacitors to lower the effective ESR. The ceramic capacitors will handle high-frequency dynamic load changes while the electrolytic capacitors are used to handle low frequency dynamic load changes. Ceramic capacitors will also reduce any high frequency noise at the load.

It is equally important to use low resistance and low inductance PCB layouts and cabling.

External decoupling capacitors will become part of the control loop of the DC/DC converter and may affect the stability margins. As a "rule of thumb", 100 \( \mu \text{F} / \text{A} \) of output current can be added without any additional analysis.

The recommended absolute maximum value of output capacitance is 5 000 \( \mu \text{F} \). For further information please contact your local Flex representative.

Output Voltage Adjust (\( V_{\text{adj}} \))
All converters have an Output Voltage Adjust pin (\( V_{\text{adj}} \)). This pin can be used to adjust the output voltage above Output voltage initial setting.

The output voltage can not be decreased by means of external resistors or other external circuitry.

The output voltage can be increased by means of external resistors or other external circuitry. If other circuitry is used, the slew rate has to be limited to maximum 5 V/ms.

To increase the output voltage, the resistor should be connected between the \( V_{\text{adj}} \) pin and Positive input pin. The resistor value of the Output voltage adjust function is according to information given under the Output section for the respective product.
Operating information continued

Parallel Operation
Paralleling of several converters is easily accomplished by direct connection of the output voltage terminal pins. The load regulation characteristic is specifically designed for optimum paralleling performance. Load sharing between converters will be within ±10%. It is recommended not to exceed $P_c = n \times 0.9 \times P_{\text{omax}}$, where $P_{\text{omax}}$ is the maximum converter output power and $n$ the number of paralleled converters, to prevent overloading any of the converters and thereby decreasing the reliability performance.

Over Temperature Protection (OTP)
The PKR 4000A Series DC/DC converters include an internal over temperature shutdown circuit. When the temperature exceeds 130°C - 150°C on the control circuit the converter will shut down. The DC/DC converter will make continuous attempts to start up (non-latching mode) and resume normal operation automatically when the temperature has dropped >15°C below the temperature threshold.

Over Current Protection (OCP)
The converters include current limiting circuitry for protection at continuous overload. The output voltage will decrease towards zero for output currents in excess of max output current (max I_c). The converter will resume normal operation after removal of the overload. The load distribution should be designed for the maximum output short circuit current specified.

Thermal Consideration

General
The converters are designed to operate in different thermal environments and sufficient cooling must be provided to ensure reliable operation. Cooling is achieved mainly by conduction, from the pins to the PCB board, and convection, which is dependant on the airflow across the converter. Increased airflow enhances the cooling of the converter.

The Output Current Derating graph found in the Output section for each model provides the available output current vs. ambient air temperature and air velocity at $V_{\text{in}} = 53$ V.

The converter is tested on a 254 x 254 mm, 35 µm (1 oz), 8-layer test board mounted vertically in a wind tunnel with a cross-section of 305 x 305 mm.

Proper cooling of the converter can be verified by measuring the temperature at position P1. The temperature at these positions should not exceed the max values provided in the table below.

Note that the max value is the absolute maximum rating (non destruction) and that the electrical Output data is guaranteed up to $T_{\text{ref}} +85^\circ$C.
Thermal Consideration continued

Definition of reference temperature ($T_{ref}$)
The reference temperature is used to monitor the temperature limits of the product. Temperatures above maximum $T_{ref}$ are not allowed and may cause degradation or permanent damage to the product. $T_{ref}$ is also used to define the temperature range for normal operating conditions. $T_{ref}$ is defined by the design and used to guarantee safety margins, proper operation and high reliability of the module.

Ambient Temperature Calculation
By using the thermal resistance the maximum allowed ambient temperature can be calculated.

1. The power loss is calculated by using the formula $((1/\eta) - 1) \times \text{output power} = \text{power losses (Pd)}$. $\eta =$ efficiency of converter. E.g $85 \% = 0.85$

2. Find the thermal resistance ($R_{th}$) in the Thermal Resistance graph found in the Output section for each model. Calculate the temperature increase ($\Delta T$). $\Delta T = R_{th} \times Pd$

3. Max allowed ambient temperature is: Max $T_{ref} - \Delta T$. E.g PKR 4713 SI at 1m/s:

1. $((1/0.85) - 1) \times 7 \text{ W} = 1.24 \text{ W}$
2. $1.24 \text{ W} \times 14.0^\circ\text{C/W} = 17.3^\circ\text{C}$
3. $110^\circ \text{C} - 17.3^\circ \text{C} = \text{max ambient temperature is 92.7^\circC}$

The actual temperature will be dependent on several factors such as the PCB size, number of layers and direction of airflow.

</tbody>
</table>

**Notes:**

1. The solder bumps are designed to allow capactity compensation by melting of the solder bumps between the product and the application board.
   The capactity corresponds to the requirements for BGA low melt solder balls.
   (Jedec Publication 95, Design Guide 4.74 revision E, September 2005)

2. Max product height is measured from bottom side of the product PCB but excluding the solder bump (reduced to solder joint thickness after assembly)

3. Absolute keep out area = 48.8 x 29.1 based on mechanical outline and assembly tolerances. The recommended keep out area is +3 mm on each long side to facilitate repair (removal and re-mounting) with a hot air nozzle.

4. Pickup surface on marking label is 10.5x11.00 [0.413x0.433].
   Pickup location varies between product variants.

- **Weight:** 9-12 g

Soldering Information - Surface Mounting
The surface mount version of the product is intended for convection reflow or vapor phase reflow in SnPb or Pb-free reflow processes.

Mounting Options
The surface mount version is available in two options, SnPb based or SnAgCu based (Pb-free) solder bumps.

The SnPb solder bumps are intended for SnPb solder paste on the host board and to be reflowed in SnPb reflow process temperatures, typically +210 to +220°C.

The Pb-free solder bumps are intended for Pb-free solder paste on the host board and to be reflowed in Pb-free reflow process temperatures, typically +235 to +250°C.

Note that recommendations for minimum and maximum pin temperature – and maximum peak product temperature – are different depending on mounting option, reflow process type and if the dry packing of the products has been kept intact.

General Reflow Profile Recommendations
The reflow profile should be optimised to avoid excessive heating of the product. It is recommended to have a sufficiently extended preheat time to ensure an even temperature across the host PCB and to minimize the time in reflow.

A no-clean flux is recommended to avoid entrapment of cleaning fluids in cavities inside the product or between the product and the host board, since cleaning residues may affect long time reliability and isolation voltage.

1 Note: for mixed SnPb / Pb-free soldering, special recommendations apply

Mixed Solder Process Recommendations
When using products with Pb-free solder bumps and thereby mixing Pb-free solder with SnPb paste on the host board and reflowing at SnPb process temperatures (backwards compatibility), special recommendations apply.

An extended preheat time between +170°C and +180°C for 60 to 90s and a pin reflow temperature (Tpin) between +220°C and +225°C for 30 to 60 s is recommended.

The extended preheat and soak at reflow temperature will minimize temperature gradients and maximize the wetting and solder mixing in the final solder joints. The use of nitrogen reflow atmosphere will further improve the solder joint quality.

Dry Pack Information
Products intended for Pb-free reflow processes are delivered in standard moisture barrier bags according to IPC/JEDEC standard J-STD-033 (Handling, packing, shipping and use of moisture/reflow sensitivity surface mount devices). The SnPb option of this product is also delivered in dry packing.

Using products in high temperature Pb-free soldering processes requires dry pack storage and handling. In case the products have been stored in an uncontrolled environment and no longer can be considered dry, the modules must be baked according to J-STD-033.

Pin Temperature Recommendations
Pin number 5 and 14 are chosen as reference locations for the minimum pin (solder joint) temperature recommendations since these will likely be the coolest solder joints during reflow.

SnPb Solder Processes
Minimum pin temperature: for SnPb solder processes, a pin temperature (T_{pin}) in excess of the solder melting temperature, (T_L, +183°C for Sn63Pb37) for more than 30 seconds, and a peak temperature of +210°C is recommended to ensure a reliable solder joint.

A maximum pin temperature of +225°C should be sufficient for most applications but depending on type of solder paste and flux system used on the host board, up to a recommended maximum temperature of +245°C could be used, provided that the products are kept in a controlled environment (dry pack handling and storage) prior to assembly.

Pb-free Solder Processes
For Pb-free solder processes, a pin temperature (T_{pin}) in excess of the solder melting temperature (T_L, +217 to +221 °C for SnAgCu solder alloys) for more than 30 seconds, and a peak temperature of +235°C on all solder joints is recommended to ensure a reliable solder joint.

Maximum Product Temperature Requirements
Top of the product PCB near pin 9 or 10 are chosen as reference locations for the maximum (peak) allowed product temperature (T_{PRODUCT}), since these will likely be the warmest parts of the product during the reflow process.

SnPb Solder Processes
For conventional SnPb solder processes, the product is qualified for MSL 1 according to IPC/JEDEC standard J-STD-020C (no dry pack handling or controlled environment required)

During reflow, T_{PRODUCT} must not exceed +225 °C at any time.

If the products are handled as MSL 3 products, they can withstand up to +260°C as in Pb-free solder processes.

Pb-free Solder Processes
For Pb-free solder processes, the product is qualified for MSL 3 according to IPC/JEDEC standard J-STD-020C.

During reflow, T_{PRODUCT} must not exceed +260 °C at any time.

Surface Mount Assembly and Repair
The solder bumps of the product require particular care during assembly since the solder bumps are hidden between the host board and the product’s PCB. Special procedures are required for successful rework of these products.

Assembly
Automatic pick and place equipment should be used to mount the product on the host board. The use of a vision system, utilizing the fiducials on the bottom side of the product, will ensure adequate accuracy. Manual mounting of solder bump products is not recommended.

Note that the actual position of the pick up surface may vary between variants within the product program and is not necessarily in the center of the product outline.

If necessary, it is recommended to fine tune the solder print aperture size to optimize the amount of deposited solder with consideration to screen thickness and solder print capability.

Repair
For a successful repair (removal and replacement) of a solder bump product, a dedicated rework system should be used. The rework system should preferably utilize a bottom side heater and a dedicated hot air nozzle to heat the solder bumps to reflow temperature.

The product is an open frame design with a pick up surface on a large central component. This pick up surface can not be used for removal with a vacuum nozzle since the component solder joints may have melted during the removal reflow.

In order not to damage the product and nearby components during removal and replacement with a new product, it is recommended to use a double wall design of the hot air nozzle to direct the air flow only to the edges of the product, see ‘Assembly Information’ in the mechanical drawing.

Soldering Information – Hole Mounting
The hole mount version of the product is intended for manual or wave soldering in plated through holes on the host board. When wave soldering is used, the temperature on the pins is specified to maximum +270 °C for maximum 10 seconds. A maximum preheat rate of 4°C/s and a preheat temperature of max of +150°C is suggested.

When soldering by hand, care should be taken to avoid direct contact between the hot soldering iron tip and the pins for more than a few seconds in order to prevent overheating.

A no-clean flux is recommended to avoid entrapment of cleaning fluids in cavities inside the product or between the product and the host board. The cleaning residues may affect long time reliability and isolation voltage.
Delivery Package Information
The surface mount version of the product is delivered in antistatic injection molded trays (Jedec design guide 4.10D standard) or in antistatic carrier tape (EIA 481 standard)

The hole mount version is delivered in antistatic tubes.
